DETAILED ACTION

Applicant believes that claims 1-9 are generic and as stated in the previous restriction requirement that such is not the case as there are two types of devices ones that have unequal heights and one that has equal heights. There are no generic claim(s) that encompasses both cases and thus it is impossible for claims 1-9 to be generic. Also the elected invention is one that is directed toward purely a photo-detecting arrangement and accordingly claims 1-5 and 7-9 can not possibly be considered generic as these claims also have a optical element (LED) connected to the output of the semiconductor circuit. The elected species has no optical element of any kind connected to the output of the semiconductor device ("1") and as such claims 1-5, 7-14 and 16 are directed to the non-elected invention.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wada US 6,703,689.

Wada discloses a common form of photo-detector wherein the photo-detector package is meant to contact the input of another semiconductor device through the solder bumps. It is well know to form an array of these elements so as to form an image or just to provide for multiple channel input in the case that the device is a communications device. Applicant says that the array is an "irregularity" arranged in which two photo-detecting elements would constitute an "irregularity" arranged arrangement.

As it is just so common place to select the number of elements to form an array based on either resolution desired or based on the fact concerning the number of channels present, it would have been obvious to one of ordinary skill in the art at the time the invention was made to made a two element array.
